Ethical Class ☐ Oxalis ☒ Papaver ☐ Magnolia ☐ Hypericum ☐ Lea

1 Specification

S-0047 is humanoid in shape, and stands at 14 feet tall. Its skin is made of a substance that the Corporation haven't been able to identify yet. It appears to be fleshy in nature and it's constantly expanding and contracting in an organic manner. S-0047's skin is also able to morph and send out many smaller fleshy skin-like protrusions. When both organic and inorganic material come into contact with the skin of S-0047, it seems to be absorbed and no further trace of the material can be discovered.

2 Containment Procedures

In order to contain S-0047 it is of utmost importance to have it inside a cell with at least 2m thick, reinforced concrete walls. It is paramount that the inside and the outside of cell employ the most up-to-date audio muffling techniques, since it needs to be as soundproof as possible. It is

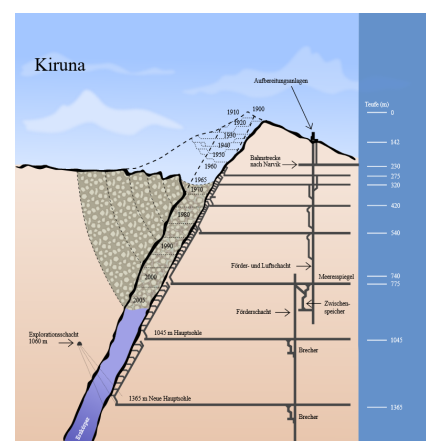

Fig. 1. A diagram showing the first known location of S-0047

advised that a loudspeaker and broadcast mechanism is located within the cell if recontainment is necessary.

3 Recontainment Procedures

Due to S-0047's predatory nature to sounds and movement, the installation of a loudspeaker and broadcast equipment within its containment cell can be used to lure it back inside. The sound of screaming Category-C personnel can be played and projected over the site intercom which should be sufficient to recontain S-0047. In the event this isn't successful, [DATA EXPUNGED].

4 Behaviour

So far it appears that S-0047 only reacts to auditory stimulation, although it does need to be noted that it does respond to movement. This is likely due to the fact movement also causes disruption to particles in the air, in the same manner as sound, and S-0047 is reacting to it in the same way as audio. It has been deduced that the skin of S-0047 is its only sensory organ which it uses to detect even the smallest instances of movement and sound. Its reaction to these external stimuli has been consistent: it finds the source and stops it, and it won't stop until the sound/movement stops.

After detecting sound or movement it will shift its body towards it, locomoting in a way that utilises its fleshy tendril protrusions to pull itself along. S-0047 is also able to fit its body through even the tightest spaces. Observations have shown this to be down to a few millimetres wide.

Due to an unknown, possibly biological, mechanism within S-0047 it is always able to discern the exact location of the sound/movement. When S-0047 reaches the source of the sound/movement it will absorb the source into its fleshy skin if the source is inorganic. No trace of the source can be found afterwards. If the source is organic in nature, such as a human, it will absorb them in a different way extracting what can only be assumed to be their essence/soul. While S-0047 has no facial features it has been described by some personnel who have witnessed it to be screaming, even though S-0047 is silent and is incapable of making any noise other than noise from the environment it interacts with. It has been observed to use its fleshy tendrils to grapple its prey in order to better absorb them.

Further analysis into how S-0047 'kills' its victims by Dr Mikail Rostov.

Behavioural Assessment 1 Test Subject C-7584 was placed within S-0047's containment chamber in a safe manner to avoid a containment breach. C-7584, unaware of the nature of S-0047 started panicking, triggering S-0047's predatory response. After a matter of seconds, S-0047 had grappled the C-7584 with its fleshy tendrils and an orifice on the 'head' part of

S-0047 opened up to expose what seemed to be a bright yellow orb of light deep within the maw. S-0047 lifted the C-7584 up and held them close to the bright light emanating from the orifice which caused a major amount of visible stress for C-7584.

After being exposed to the light the subject showed what appeared to be a small white strand of light coming up from his throat. The light within S-0047 absorbed this strand of white light which appeared to leave the C-7584 alive but completely unresponsive and husk-like. S-0047 then went on to absorb the body of the C-7584 in the same way it was documented to absorb inorganic material, leaving no trace. It was impossible to analyse C-7584 after they had this white strand of light removed from them, as S-0047 absorbed them before we could remove the body from the containment cell. **[FURTHER TESTING APPROVED]**

Behavioural Assessment 2 Attempts at communication have yielded unexpected results. Due to the nature of S-0047, attempts to communicate with it can only be done through sound/movement. This has proved to be risky due to its predatory behaviour. However, some audio that we have exposed it to has elicited less aggressive responses. Audio clip **[REDACTED]** is an example of a piece of audio that seemed to calm S-0047. Some witnesses even described its movement as dance-like. The responses to different pieces of audio have been completely random and we've yet to be able to establish any type of meaningful communication or response from S-0047. **[FURTHER TESTING APPROVED]**

5 Origination

S-0047 was discovered inside a mine located in northern Sweden, Kiruna in 1979. After numerous missing persons reports and claims of supernatural activity, the mine and surrounding land was acquired by the Corporation. OSTF squads were sent in first, where they discovered S-0047 inside the mine. Its white, fleshy skin was perfectly camouflaged with the white, water-eroded rock formations, and as a result there were a number of casualties. After an OSTF squad discovered the nature of S-0047 they were able to lure it into a suitable containment cell in a similar many to how we still recontain it now. **[See [Recontainment Procedures](#)]**
